organismal growth is a multi gene regulatory process that integrates various physiological signaling pathways in vivo from energy metabolism to somatic growth in fully developed animals endocrine regulation assures that homeostasis and growth can adapt the organism to changing environmental and biological conditions thus being the central regulatory hub for physiological responses much attention has been paid to the endocrine regulation of aquatic organism growth and regulation these endocrine systems include neuroendocrine and insulin like growth factors and their downstream molecules many signaling molecules promote tissue growth and regulate the metabolism of many nutrients in vivo like other animals aquatic animals respond to environmental stimuli through endocrine regulation that modulates physiological and environmental responses environmental stressors can affect aquatic ecosystems and their inhabitants including but not limited to temperature hypoxia salinity heavy metal nanomaterials pesticides microplastics and other toxic pollutants the presence of stress disrupts the homeostasis of aquatic animals inducing physiological molecular and behavioral changes research into the endocrine regulation and physiological adaptation in aquatic organisms and the molecular mechanisms involved can aid in

forecasting danger and assessing physiological well being that has never been more present than now amid climate change where aquatic environments are amongst the most susceptible biomes this research topic addresses these emergent questions by inviting studies investigating and discussing the molecular and cellular mechanisms of endocrine regulation and physiological adaptation in aquatic organisms to environmental stresses gaining an insight into the current knowledge of these responses and the related mechanisms will give us a deeper understanding of aquatic animal biology and adaptation
