decoherence a concept known only to few physicists when the first edition appeared in 1996 has since become firmly established experimentally and understood theoretically as well as widely reported in the literature the major consequences of decoherence are the emergence of classicality in general superselection rules the border line between microscopic and macroscopic behavior in molecules and field theory the emergence of classical spacetime and the appearance of quantum jumps the most important new developments in this rapidly evolving field are included in the

second edition of this book which has become a standard reference on the subject all chapters have been thoroughly revised and updated new fields of application now addressed span chaos theory quantum information neuroscience primordial fluctuations in cosmology black holes and string theory experimental tests and interpretational issues while the major part of the book is concerned with environmental decoherence derived from a universal schrödinger equation later chapters address related or competing methods such as consistent histories open system dynamics algebraic approaches and collapse models

this is the first single volume about the collapse theories of quantum mechanics which is becoming a very active field of research in both physics and philosophy in standard quantum mechanics it is postulated that when the wave function of a quantum system is measured it no longer follows the schrödinger equation but instantaneously and randomly collapses to one of the wave functions that correspond to definite measurement results however why and how a definite measurement result appears is unknown a promising solution to this problem are collapse theories in which the collapse of the wave function is spontaneous and dynamical chapters written by distinguished physicists and philosophers of physics discuss the origin and implications of wave function collapse the controversies around collapse models and their ontologies and new arguments for the reality of wave function collapse this is an invaluable resource for students and researchers interested in the philosophy of physics and foundations of quantum mechanics

the contributions to this volume are based on selected lectures from the first international workshop on decoherence information complexity and entropy dice the aim of this volume is to reflect the growing importance of common concepts behind seemingly different fields such as quantum mechanics general relativity and statistical physics in a form accessible to nonspecialist researchers many presentations include original results which published here for the first time
