in recent years inorganic polymers have attracted much attention in nano biomedicine in particular in the area of regenerative medicine
and drug delivery this growing interest in inorganic polymers has been further accelerated by the development of new synthetic and
analytical methods in the field of nanotechnology and nanochemistry examples for biomedical inorganic polymers that had been proven to

exhibit biomedical effects and or have been applied in preclinical or clinical trials are polysilicate silica glass such as naturally formed biosilica and synthetic bioglass and inorganic polyphosphate some members of the mentioned biomedical inorganic polymers have already been applied e g as bioglass for bone repair and bone tissue engineering or they are used in food processing and in dental care inorganic polyphosphates however there are a number of further biological and medicinal properties of these polymers which have been elucidated in the last few years but not yet been applied for treatment of humans in addition to polysilicates and polyphosphate there are a series of other inorganic polymers including polyarsenate and polyvanadate whose biological biomedical properties have been only marginally studied so far moreover the combined application of inorganic polymers and organic polymeric molecules formation of organic inorganic hybrid materials provides a variety of new materials with novel property combinations and diverse applications in nanomedicine the planned book summarizes the present state of knowledge on a large group of inorganic polymers that had hitherto been mainly considered with regard to their chemistry but not comprehensively reviewed with respect to their potential biomedical applications
