this book examines digital transformation highlighting the pitfalls of technology centered approaches and the importance of organizational factors it suggests starting with transformation using methods like bpm seam or od the volume evaluates performance improvements risks and ways technology can support organizational goals

this volume contains a selection of articles based on lectures delivered at the ima 2001 summer program on geometric methods in inverse problems and pde control the articles are focused around a set of common tools used in the study of inverse coefficient and control problems for pdes and related differential geometric problems this book will serve as an excellent starting point for researchers wanting to pursue studies at the intersection of these mathematically exciting and practically important subjects

digital signal transforms are of a fundamental value in digital signal and image processing their role is manifold transforms selected appropriately enable substantial compressing signals and images for storage and transmission no signal recovery image reconstruction and restoration task can be efficiently solved without using digital signal transforms transforms are successfully used for logic design and digital data encryption fast transforms are the main tools for acceleration of computations in digital signal and image processing the volume collects in one book most recent developments in the theory and practice of the design and usage of transforms in digital signal and image processing it emerged from the series of reports published by tampere international centre for signal processing tampere university of technology for the volume all contributions are appropriately updated to represent the state of the art in the field and to cover the most recent developments in different aspects of the theory and applications of transforms the book consists of two parts that represent two major directions in the field development of new transforms and development of transform based signal and image processing algorithms the first part contains four chapters devoted to recent advances in transforms for image compression and switching and logic design and to new fast transforms for digital holography and tomography in the second part advanced transform based signal and image algorithms are considered signal and image local adaptive restoration methods and two complementing families of signal and image re sampling algorithms fast transform based discrete sinc interpolation and spline theory based ones publisher

first published in 1986 in the age of the computer conjecture about things mechanical has naturally led to the question of whether machines can think as the emphasis on artificial intelligence ai has grown rapidly questions about machine intelligence have begun to have a certain urgency the question we are concerned with in this book is if we can find a set of processes that machines can slavishly follow and if by so doing these machines can come up with creative thoughts what would that tell us about human beings if the machine's procedure was adapted from a human procedure that is if all the machine was doing was what we know people are doing would we abandon our inherent skepticism about the abilities of machines or would we demystify our inherent admiration for things human in a sense these are the issues dealt with in this book the author says in a sense because this book is no way a philosophical treatise rather it is an exercise in artificial intelligence and in cognitive science it is an attempt to come to understand one of the most complex problems of mind by examining some of the mechanisms of mind to define the apparatus that underlies our ability to think
